

Improving Health Decisions; A Statistical Call to Arms

Scott L. Zeger (sz@jhu.edu)
Professor of Biostatistics and Medicine
co-Director for Data Science, Hopkins *in*Health

3rd Seattle Symposium on Health Care Data Analytics
October 23, 2018

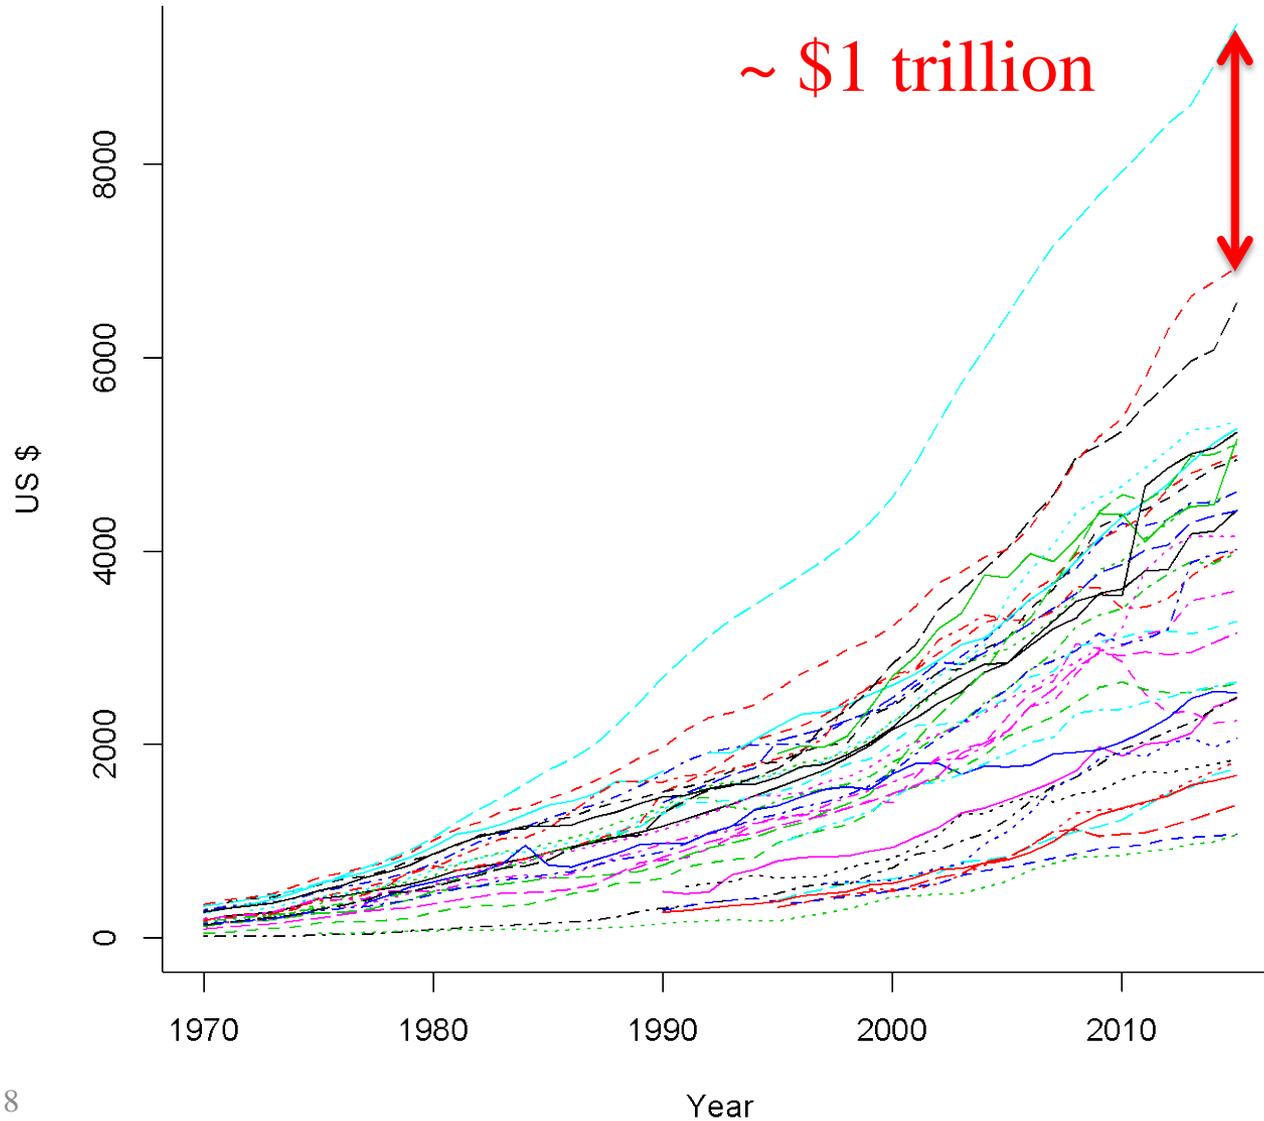

Research reported in this lecture was partially funded by a generous gift from the Greene Foundation and through a Patient-Centered Outcomes Research Institute (PCORI) Award (ME-1408-20318). The views expressed are solely the responsibility of the author and do not necessarily represent the views of the Patient-Centered Outcomes Research Institute (PCORI), its Board of Governors or Methodology Committee.

Talk Outline

- The Stew
- Short Review
- What's New
- Our View

The Stew

Per Capita **Annual** Medical Expenditures - OECD Countries

Smoking Attributable Costs for 60 Million Who Started Under 21 Years Old, 1954-2000

Disease: LC/COPD (millions case-years)	43.7
Disease: CHD Group (millions case-years)	80.8
Dollars (billions)	1,087
Deaths (million years lost)	128.0 (13m persons)

How Big is 1 Trillion?

- 1,000,000,000,000 – a million millions
- 1 trillion seconds ago was 30,000 BC
- \$1 trillion, as a stack of \$100 bills, is 630 miles high
- \$9,000 per household in the U.S.

Table. Estimates of Annual US Health Care Waste, by Category^a

	\$ in Billions					
	Annual Cost to Medicare and Medicaid in 2011 ^b			Annual Cost to US Health Care System in 2011		
	Low	Midpoint	High	Low	Midpoint	High
Failures of care delivery	26	36	45	102	128	154
Failures of care coordination	21	30	39	25	34	45
Overtreatment	67	77	87	158	192	226
Administrative complexity	16	36	56	107	248	389
Pricing failures	36	56	77	84	131	178
Fraud and abuse	30	64	98	82	177	272
Total^c	197	300	402	558	910	1263

Bad information/decisions

\$.3-.4T

^a Table entries represent the range of estimates of waste in each category from sources cited in the text. The total waste estimates are simply the sums of the category-level estimates. This simple summing is feasible because the categories are defined in such a way that wasteful behaviors could be assigned to at most 1 category and because, like Pacala and Socolow,⁹ we did not attempt to estimate interactions between or among the categories.
^b Including both state and federal costs.
^c Totals may not match the sum of components due to rounding.

Figure. Proposed "Wedges" Model for US Health Care, With Theoretical Spending Reduction Targets for 6 Categories of Waste

The "wedges" model for US health care follows the approach based on the model by Pacala and Socolow.⁹ The solid black "business as usual" line depicts a current projection of health care spending, which is estimated to grow faster than the gross domestic product (GDP), increasing the percentage of GDP spent on health care; the dashed line depicts a more sustainable level of health care spending growth that matches GDP growth, fixing the percentage of GDP spent on health care at 2011 levels. Between these lines lies the "stabilization triangle"—the reduction in national health care expenditures needed to close the gap. The 6 colored regions filling the triangle show one possible set of spending reduction targets; each region represents health care expenditures as a percentage of GDP that could be eliminated by reduction of spending in that waste category over time.

ONLINE FIRST

Eliminating Waste in US Health Care

Donald M. Berwick, MD, MPP
 Andrew D. Hackbarth, MPhil

NO MATTER HOW POLARIZED politics in the United States have become, nearly everyone agrees that health care costs are unsustainable. At almost 18% of the gross domestic product (GDP) in 2011, headed for 20% by 2020,^{1,2} the nation's increasing health care expenditures reduce the resources available for other worthy government programs, erode wages, and undermine the competitiveness of US industry. Although Medicare and Medicaid are of

ten in the limelight, the health care cost **The need is urgent to bring US health care costs into a sustainable range for both public and private payers. Commonly, programs to contain costs use cuts, such as reductions in payment levels, benefit structures, and eligibility. A less harmful strategy would reduce waste, not value-added care. The opportunity is immense. In just 6 categories of waste—overtreatment, failures of care coordination, failures in execution of care processes, administrative complexity, pricing failures, and fraud and abuse—the sum of the lowest available estimates exceeds 20% of total health care expenditures. The actual total may be far greater. The savings potentially achievable from systematic, comprehensive, and cooperative pursuit of even a fractional reduction in waste are far higher than from more direct and blunter cuts in care and coverage. The potential economic dislocations, however, are severe and require mitigation through careful transition strategies.**

Short Review

Learning Healthcare System

HealthCare System of Systems Learning

Plato's Cave

A Role for Biostatistics: *Healthcare Decision Support*

PLAY A CLINICIAN (for a moment)

40 year old man, no family history, tests positive for a life-threatening disease in a routine screen

What is his disease state; what action do you recommend?

Data from prior population of similar people

	True disease status		
Exam result	Yes	No	Total
Positive	15	985	1,000
Negative	5	8,995	9000
Total	20	9,980	10,000

Two Goals for Biostatistics

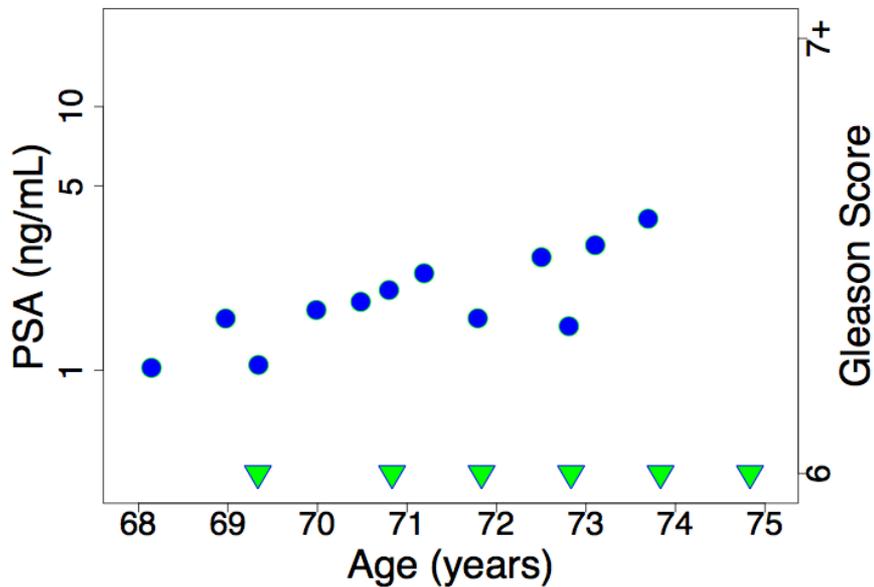

- Create the analogue of the 2x2 table for more complex measurements

Population \Leftrightarrow Individual

- Build capacity to make tables for ever narrower sets of “otherwise similar” subgroups of individuals

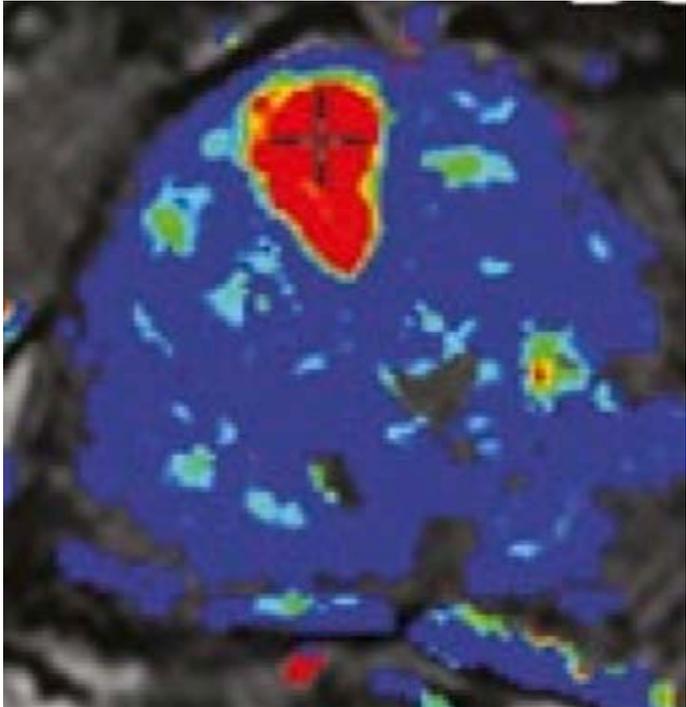

Subset, Subset, Subset

Scaling Models Across Clinics

- Biomedical, clinical and **data scientist** partnerships in each PMCOE
- IT infrastructure
 - Precision Medicine Analytics Platform (PMAP)
- Scalable strategies, policies, and procedures for more rapid construction of new models
 - Precision Medicine Centers of Excellence (PMCOEs) at JHM
- Business model that rewards science-based, value-producing clinics

Our View

Johns Hopkins Healthcare (JHHC) spends ~\$2.5 Billion per year on healthcare for 500,000 members

~ \$1 Billion spent per year produces little improvement in health status

So we build statistical models that support coherent decisions that improve outcomes, reduce costs – reinvest a small part of the \$1 Billion

Forget JHHC – Think KP

Main Points Once Again

- The Stew
 - The U.S. can no longer waste \$1 Trillion per year on healthcare (and continue as a liberal democracy)
 - A large fraction of waste ($1/3$ - $1/2$) is the result of uncertainty about health state, trajectory and risks/benefits of interventions that is exploited by current perverse incentives
- What's New – Biostatisticians are building models that reduce uncertainty and improve decisions

Our View – just a small part of the \$1 trillion wasted
be reinvested in changing the American healthcare
system
